

# On Laplace-Riemann Derivatives

S. Deb

**Abstract:** The basic properties of the  $n^{\text{th}}$  Laplace-Riemann derivative of a function  $f$  at a point  $x$  is studied.

**Keywords:** Laplace-Riemann Derivatives, Riemann - Derivatives, Derivative, Continuity, Mathematical Subject Classification 2020: 26E99, 28E99.

## I. INTRODUCTION

In the past different types of derivatives were defined and investigated [1]. Laplace derivative and Riemann derivative are such two derivatives [6]. Laplace derivative was first introduced in and studied in [2]. Laplace-Riemann derivative is another generalization of ordinary derivative which is defined with the help of the concept of the previous two derivatives [5]. In this section, we have studied the order Laplace-Riemann derivative and have shown by example that the Laplace-Riemann derivative is more general than the ordinary derivative [3]. Also, we have proved some theorems regarding monotonicity and Mean value property for the Laplace-Riemann derivative of a function having Upper semi-continuity and property D [8].

### A. Definitions and Notations

**Definition 1.1:** Let  $f : \mathbf{R} \rightarrow \mathbf{R}$  be a function, which is specially Denjoy-integrable in some neighborhood of  $x \in \mathbf{R}$ . If the limit

$$\lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(f, x, t) dt$$

exists then it is said to be the  $n^{\text{th}}$  right Laplace-Riemann derivative of  $f$  at  $x$  and is denoted by  $LRD_n^+ f(x)$ . If the limit

$$\lim_{s \rightarrow \infty} (-1)^n \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(f, x, -t) dt$$

exists then it is said to be the left Laplace-Riemann derivative of order  $n$  off at  $x$  and is denoted by  $LRD_n^- f(x)$ .

If both  $LRD_n^+ f(x)$  and  $LRD_n^- f(x)$  exist and are equal, then the common value is called the  $n - \text{th}$  Laplace-

Riemann derivative of  $f$  at  $x$  and is denoted by  $LRD_n f(x)$  [4].

The Definitions are independent of  $\delta$  [4].

### B. Properties of Laplace-Riemann Derivative

To study properties of Laplace-Riemann derivative, following lemmas are used.

**Lemma 1.1 :** If  $\psi(t) = o(t^n)$ , then

(i)

$$\lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \psi(t) dt = 0, (ii) \lim_{h \rightarrow 0} \frac{1}{h} \int_0^h \frac{\psi(t)}{t^n} dt = 0.$$

The proof is given in [4].

**Lemma 1.2:** If  $p, q$  are positive integers and  $\delta > 0$  then

$$s^q \int_0^\delta e^{-st} t^p dt = p! s^{q-p-1} + o(1) \text{ as } s \rightarrow \infty.$$

The proof is given in [5]

**Lemma 1.3:** If  $p, q$  are positive integers and  $\delta > 0$  then

$$s^q \int_0^\delta e^{-st} t^p dt = p! s^{q-p-1} + o(1) \text{ as } s \rightarrow \infty.$$

The proof is clear [6]

Also, we know:

1. For  $f : \mathbf{R} \rightarrow \mathbf{R}$  be a function, which is special Denjoy integrable in some neighborhood of  $x \in \mathbf{R}$ , if the  $n^{\text{th}}$  Peano derivative of  $f$  at  $x$  i. e.  $f_n(x)$  exists then  $LRD_n f(x)$  exists and  $f_n(x) = LRD_n f(x)$ . The converse of the Theorem is not true [4].

2. If the  $n^{\text{th}}$  general derivative of  $f$  at  $x$  i. e.  $f^n(x)$  exists then the  $n - \text{th}$  Laplace-Riemann derivative of  $f$  at  $x$  i. e.  $LRD_n f(x)$  exists with same value but not conversely [3].

3.  $RD_n^- f(x) \leq LRD_n^- f(x) \leq LRD_n^+ f(x) \leq RD_n^+ f(x)$

Here,  $RD_n^+ f(x)$  and  $RD_n^- f(x)$  are the right and left  $n^{\text{th}}$  Riemann derivative off at  $x$  respectively. The converse is not true in general [4].

4.  $LD_n^- f(x) \leq LRD_n^- f(x) \leq LRD_n^+ f(x) \leq LD_n^+ f(x)$

Here,  $LD_n^+ f(x)$  and  $LD_n^- f(x)$  are the right and left  $n^{\text{th}}$  Laplace derivative off at  $x$  respectively. The converse is not true in general [7].

**Remark:** Laplace-Riemann derivative is more general than ordinary derivative, Peano derivative, Laplace derivative, Riemann derivative.

**C. Basic Property**

1)  $LRD_n(f + g)(x) = LRD_n f(x) + LRD_n g(x)$ .

**Proof.**

$$\begin{aligned} &LRD_n(f + g)(x) \\ &= \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(f + g, x, t) dt \\ &= \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \sum_{j=0}^n (-1)^{n-j} \binom{n}{j} (f + g)(x + jt) dt \\ &= \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \sum_{j=0}^n (-1)^{n-j} \binom{n}{j} f(x + jt) dt + \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \sum_{j=0}^n (-1)^{n-j} \binom{n}{j} g(x + jt) dt \\ &= \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(f, x, t) dt + \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(g, x, t) dt \\ &= LRD_n f(x) + LRD_n g(x). \end{aligned}$$

2) For a scalar k,  $LRD_n(kf)(x) = kLRD_n f(x)$

**Proof.**

$$\begin{aligned} &LRD_n(kf)(x) \\ &= \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(kf, x, t) dt \\ &= \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \sum_{j=0}^n (-1)^{n-j} \binom{n}{j} (kf)(x + jt) dt \\ &= k \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(f, x, t) dt \\ &= kLRD_n f(x) \end{aligned}$$

3)  $LRD_n(f - g)(x) = LRD_n f(x) - LRD_n g(x)$ .

[Evident from 1) and 2)]

**D. Example of Laplace-Riemann Derivative of Some Common Functions**

(i) Let  $f(x) = e^x$ .

$$\begin{aligned} \Delta^1(f, x, t) &= f(x + t) - f(x) = e^{x+t} - e^x = [e^t - 1]e^x \\ \lim_{s \rightarrow \infty} s^2 \int_0^\delta e^{-st} \Delta^1(f, x, t) dt &= \lim_{s \rightarrow \infty} s^2 \int_0^\delta e^{-st} [e^t - 1]e^x dt = \lim_{s \rightarrow \infty} s^2 e^x \left[ \frac{e^{-(s-1)\delta} - 1}{1-s} - \frac{e^{-s\delta} - 1}{-s} \right] = e^x \end{aligned}$$

Thus,  $LRD_1 f(x) = e^x$

$$\Delta^2(f, x, t) = f(x + 2t) - f(x + t) + f(x) = e^{x+2t} - e^{x+t} + e^x = [e^{2t} - e^t + 1]e^x$$

$$\begin{aligned} &LRD_2 f(x) \\ &= \lim_{s \rightarrow \infty} \frac{s^3}{2!} \int_0^\delta e^{-st} \Delta^2(f, x, t) dt \\ &= \lim_{s \rightarrow \infty} \frac{s^3}{2!} \int_0^\delta e^{-st} [e^{2t} - e^t + 1]e^x dt \end{aligned}$$

$$\begin{aligned}
 &= e^x \lim_{s \rightarrow \infty} \frac{s^3}{2!} \left[ \frac{e^{-(s-2)\delta} - 1}{2-s} - \frac{e^{-(s-1)\delta} - 1}{1-s} + \frac{e^{-s\delta} - 1}{-s} \right] \\
 &= e^x \lim_{s \rightarrow \infty} \frac{s^3}{2!} \left[ \frac{e^{-(s-2)\delta}}{2-s} - \frac{e^{-(s-1)\delta}}{1-s} + \frac{e^{-s\delta}}{-s} \right] + e^x \lim_{s \rightarrow \infty} \frac{s^3}{2!} \left[ \frac{-1}{2-s} - \frac{-1}{1-s} + \frac{-1}{-s} \right] \\
 &= 0 + e^x \\
 &= e^x
 \end{aligned}$$

Thus  $LRD_2 f(x) = e^x$

(ii) Let  $f(x) = x^2$ .

$$\begin{aligned}
 \Delta(f, x, t) &= f(x+t) - f(x) = (x+t)^2 - x^2 = t(2x+t) = 2xt + t^2 \\
 \Delta^2(f, x, t) &= \Delta f(x+t) - \Delta f(x) \\
 &= [f(x+2t) - f(x+t)] - [f(x+t) - f(x)] \\
 &= f(x+2t) - 2f(x+t) + f(x) \\
 &= (x+2t)^2 - 2(x+t)^2 + x^2 \\
 &= 2t^2
 \end{aligned}$$

$$LRD_1 f(x) = \lim_{s \rightarrow \infty} \frac{s^2}{1!} \int_0^\delta e^{-st} \Delta^1(f, x, t) dt = 2x \lim_{s \rightarrow \infty} \frac{s^2}{1!} \int_0^\delta e^{-st} t dt + 2 \lim_{s \rightarrow \infty} \frac{s^2}{1!} \int_0^\delta e^{-st} t^2 dt = 2x$$

$$LRD_2 f(x) = \lim_{s \rightarrow \infty} \frac{s^3}{2!} \int_0^\delta e^{-st} \Delta^2(f, x, t) dt = 2 \lim_{s \rightarrow \infty} \frac{s^3}{2!} \int_0^\delta e^{-st} t^2 dt = 2.$$

## II. MAIN RESULTS

**Theorem 2.1:** Let  $f$  be a non-decreasing function in  $[a, b]$ , then  $LRD_1^+ f \geq 0$  in  $[a, b]$ . The converse is also true.

$$LRD_1^+ f(x) = \lim_{s \rightarrow \infty} s^2 \int_0^\delta e^{-st} \Delta(f, x, h) dh = \lim_{s \rightarrow \infty} s^2 \int_0^\delta e^{-st} [f(x+h) - f(x)] dh \geq 0,$$

as  $f(x+h) - f(x) \geq 0$  for all  $h \in [0, \delta]$ . Hence,  $LRD_1^+ f \geq 0$  in  $[a, b]$ .

Conversely,

suppose  $LRD_1^+ f \geq 0$  in  $[a, b]$

$$\therefore \lim_{s \rightarrow \infty} s^2 \int_0^\delta e^{-st} [f(x+h) - f(x)] dh \geq 0$$

$\Rightarrow f(x+h) - f(x) \geq 0$  for all  $h \in [0, \delta]$ .

Therefore,  $f$  is non-decreasing in  $[a, b]$

**Theorem 2.2 :** Let  $f$  be a function which is continuous in  $[a, b]$ ,  $LRD_1^+ f$  and  $LRD_1^- f$  exist in a set  $E$  contained in  $[a, b]$ , then  $LRD_1^+ f, LRD_1^- f \in \mathbf{B}_1(\mathbf{E})$ . Moreover, if (i)  $LRD_p f$  is finite, (ii)  $LRD_i f$  is continuous in  $E$ ,  $i = 0, 1, \dots, p$ , (iii)  $LRD_{p+1}^+ f$  and

**Proof.** Let  $\delta$  be arbitrary small number such that  $x + \delta \in [a, b]$  whenever  $x \in [a, b]$ .

$LRD_{p+1}^- f$  exist in  $E$ , then  $LRD_{p+1}^+ f, LRD_{p+1}^- f \in \mathbf{B}_1(\mathbf{E})$ .

**Proof.**

Given  $f$  is a function which is continuous in  $[a, b]$ ,  $LRD_1^+ f$  and  $LRD_1^- f$  exist in a set  $E$  contained in  $[a, b]$ .

Since  $LRD_1^+ f$  and  $LRD_1^- f$  exist in  $E$ ,

$$\lim_{s \rightarrow \infty} s^2 \int_0^\delta e^{-st} \Delta(f, x, t) dt \quad \text{and} \quad \lim_{s \rightarrow \infty} (-1)^n s^2 \int_0^\delta e^{-st} \Delta(f, x, t) dt$$

$$\lim_{s \rightarrow \infty} (-1)^n s^2 \int_0^\delta e^{-st} \Delta(f, x, t) dt$$

exist in  $E$ . Let,

$$F_n(x) = n^2 \int_0^\delta e^{-nt} \Delta^1(f, x, t) dt, G_n(x) = (-1)n^2 \int_0^\delta e^{-nt} \Delta^1(f, x, t) dt$$

It is obvious that  $F_n(x), G_n(x)$  are continuous in  $E$ .

$[f_0]$

$$\lim_{n \rightarrow \infty} F_n(x) = LRD_1^+ f(x), \lim_{n \rightarrow \infty} G_n(x) = LRD_1^- f(x)$$

$$Phi_n(x) = \frac{n^{p+2}}{(p+1)!} \int_0^\delta e^{-nt} \Delta^{p+1}(f, x, t) dt, \Psi_n(x) = (-1)^{p+1} \frac{n^{p+2}}{(p+1)!} \int_0^\delta e^{-nt} \Delta^{p+1}(f, x, t) dt,$$

It is obvious that  $[f_0] \Phi_n(x), \Psi_n(x)$  are continuous in  $E$ .

$$n \lim_{s \rightarrow \infty} \Phi_n(x) = LRD_{p+1}^+ f(x), \lim_{n \rightarrow \infty} \Psi_{p+1}(x) = LRD_{p+1}^- f(x)$$

So,  $LRD_{p+1}^+ f(x), LRD_{p+1}^- f(x) \in \mathbf{B}_1(\mathbf{E})$ .

**Note 2.1.** : Let  $f$  be a function  $[f_0]$  in  $[a, b]$ . If  $f$  is non-decreasing in  $[a, b]$ , then  $LRD_n f(x) \geq 0$  in  $[a, b]$ .

**Proof.** Suppose  $\alpha, \beta \in [a, b]$ , such that  $\alpha < \beta$ ? So,  $f(\alpha) \leq f(\beta)$ .

Now, for any  $[f_0] x_0 \in (a, b)$  and for any  $\delta$  satisfying  $0 < \delta < (b - x_0)$ , we have  $f(x_0 + \delta) \geq f(x_0)$ .

$$\Delta^n(f, x, h) = \sum_{i=0}^n (-1)^{n-i} \binom{n}{i} f(x + ih)$$

Let us take  $h(> 0)$  in a way such that  $\max\{0, h, 2h, \dots, (n-1)h\} \leq \delta$ .

Hence,

$$\begin{aligned} &\Delta^n(f, x_0, h) \\ &= \sum_{i=0}^n (-1)^{n-i} \binom{n}{i} f(x_0 + ih) \\ &\Rightarrow \Delta^n(f, x_0, h) \geq \sum_{i=0}^{n-1} (-1)^{n-i} \binom{n}{i} f(x_0) + f(x_0 + nh) \\ &\Rightarrow \Delta^n(f, x_0, h) \geq f(x_0) \sum_{i=0}^{n-1} (-1)^{n-i} \binom{n}{i} + f(x_0 + nh) - f(x_0) \\ &\Rightarrow \Delta^n(f, x_0, h) \geq f(x_0)(-1+1)^n + f(x_0 + nh) - f(x_0) \\ &\Rightarrow \Delta^n(f, x_0, h) \geq f(x_0 + nh) - f(x_0) \geq 0 \end{aligned}$$

Then

$$LRD_n f(x) = \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(f, x, h) dh \geq 0,$$

provided the limit exists.

**Theorem 2.3:** Let  $[f_0] f$  be an upper semi-continuous function with the property  $D$  in the closed interval  $[a, b]$ . If  $E = \{x \in [a, b] : LRD_n^+ f(x) f \leq 0\}$  and  $f(E)$  has no sub-interval, then  $f$  is non-decreasing in  $[a, b]$ .

**Proof.** Suppose  $\alpha, \beta \in [a, b]$ , such that  $[f_0] \alpha < \beta$ . So,  $f(\alpha) > f(\beta)$ .

So,  $[f_0] LRD_1^+ f(x), LRD_1^- f(x) \in \mathbf{B}_1(\mathbf{E})$ .

Suppose, moreover, if (i)  $[f_0] LRD_p f$  is finite, (ii)  $[f_0]$

$LRD_i f$  is continuous in  $E$ ,  $i = 0, 1, \dots, p$ , (iii)  $LRD_{p+1}^+ f$  and  $[f_0] LRD_{p+1}^- f$  exist in  $[f_0]E$ . Let,

Now, let  $y_0 \in (f(\alpha), f(\beta))$  such that  $y_0$  doesn't belong to  $[f_0] f(E)$ .

Let  $S = \{x \in [a, b] : f(x) \geq y_0\}$  and  $[f_0] x_0 = \sup S$ .

Since  $[f_0] f [f_0]$  is an upper semi-continuous function with property  $D$  in  $[a, b]$ ,  $[f_0] S$  is closed and thus  $x_0 \in S$ . Therefore,  $f(x_0) \geq y_0$ . We will show that  $f(x_0) = y_0$ .

If not, there exist  $\eta$  satisfying  $f(\beta) < y_0 < \eta < f(x_0)$  and  $\xi \in (x_0, \beta)$ , such that  $f(\xi) = \eta$ . It contradicts that  $x_0 = \sup S$ . So,  $f(x_0) = y_0$ .

Since  $f$  is an upper semi-continuous function with property  $D$  in  $[a, b]$  and  $x_0 < \beta$ , for  $x_0 < x < \beta$ ,  $[f_0] f(x) < f(x_0)$ .

If  $[f_0] 0 < \delta < (\beta - x_0)$ , then  $f(x_0 + \delta) - f(x_0) < 0$ .

Again,  $f$  being upper semi-continuous function with property  $D$  in  $[a, b]$ , for any  $y_0 > y$  there is a neighbourhood  $U$  of  $x_0$  such that  $y < f(x) < y_0$ , whenever  $x \in U$ .

$$\Delta^n(f, x_0, h) = \sum_{i=0}^n (-1)^{n-i} \binom{n}{i} f(x_0 + ih)$$

Let us take  $h(> 0)$  in a way such that  $x_0 + ih \in U_{x_0+nh}$  for all  $i = 0, 1, \dots, n$  and  $\max\{0, h, 2h, \dots, (n-1)h\} \leq \delta$ .

Therefore,

$$\begin{aligned} &\Delta^n(f, x_0, h) \\ &= \sum_{i=0}^n (-1)^{n-i} \binom{n}{i} f(x_0 + ih) \\ &\Rightarrow \Delta^n(f, x_0, h) < \sum_{i=0}^{n-1} (-1)^{n-i} \binom{n}{i} f(x_0) + f(x_0 + nh) \\ &\Rightarrow \Delta^n(f, x_0, h) < f(x_0) \sum_{i=0}^{n-1} (-1)^{n-i} \binom{n}{i} + f(x_0 + nh) - f(x_0) \\ &\Rightarrow \Delta^n(f, x_0, h) < f(x_0)(-1+1)^n + f(x_0 + nh) - f(x_0) \\ &\Rightarrow \Delta^n(f, x_0, h) < f(x_0 + nh) - f(x_0) < 0 \end{aligned}$$

Then

$$LRD_n f(x_0) = \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(f, x_0, h) dh \leq 0,$$

implies  $x_0 \in S$  and hence  $y_0 \in E$ , a contradiction.

So, our initial assumption is wrong. There cannot be  $\alpha, \beta \in [a, b]$ , such that  $\alpha < \beta$ . So,  $f(\alpha) > f(\beta)$ . So,  $f$  is non-decreasing in  $[a, b]$ .

**Theorem 2.4 :** Let  $f$  be an upper semi-continuous function which has the property  $D$  in  $[a, b]$ ,  $LRD_n f(x) \geq 0$  in  $[a, b]$  except an enumerable set  $E$ . Then  $f$  is non-decreasing in  $[a, b]$ .

**Proof.** Suppose  $\delta > 0$  be arbitrarily small number and  $g(x) = f(x) + \delta x$ .

$$\begin{aligned} LRD_n^+ g(x) &= \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(g, x, h) dh \\ &= \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(f, x, h) dh + \delta \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(I, x, h) dh, I(x) = x \\ &= LRD_n f(x), \end{aligned}$$

$$\text{as } \Delta^n(I, x, h) = 0$$

Here,  $g$  is also an upper semi-continuous function with property  $D$  in  $[a, b]$ , moreover  $g(E)$  is measurable thus contains no sub-interval. So,  $g$  is non-decreasing in  $[a, b]$ .

Since  $\delta$  is arbitrarily small positive number,  $f$  is non-decreasing in  $[a, b]$ .

**Theorem 2.5 :** Let  $f$  be an upper semi-continuous function which has the property  $D$  in  $[a, b]$ ,  $LRD_n f(x) \geq 0$  in  $[a, b]$  almost everywhere in  $[a, b]$ ,  $LRD_n^+ f(x) > -\infty$  in  $[a, b]$  except an enumerable set  $E$ . Then  $f$  is non-decreasing in  $[a, b]$ .

**Proof.** Let  $A = \{x \in [a, b] : LRD_n^+ f(x) < 0\}$ . Clearly,  $m(A) = 0$ . Suppose  $\sigma$  is a continuous, non-decreasing function in  $[a, b]$  such that  $\Delta^n(\sigma, x, h) \geq 0$  in  $[a, b]$  except  $A$ .

We consider an arbitrary small positive number  $\delta$  and take  $g(x) = f(x) + \delta \sigma(x)$ . Then  $g$  an upper semi-continuous function with property  $D$  in  $[a, b]$ ,

$$\begin{aligned} LRD_n^+ g(x) &= \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(g, x, h) dh \\ &= \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(f, x, h) dh + \delta \lim_{s \rightarrow \infty} \frac{s^{n+1}}{n!} \int_0^\delta e^{-st} \Delta^n(\sigma, x, h) dh \\ &= LRD_n f(x) + \delta LRD_n \sigma(x), \end{aligned}$$

Therefore,  $LRD_n^+ g(x) \geq 0$  almost everywhere in  $[a, b]$  except  $A$ . Hence,  $g$  is non-decreasing in  $[a, b]$ .

Since  $\delta$  is arbitrarily small positive number,  $f$  is non-decreasing in  $[a, b]$ .

**Note 2.1:** Example of function  $\sigma$  which is continuous, non-decreasing in  $[a, b]$  such that  $\Delta^n(\sigma, x, h) \geq 0$  in  $[a, b]$  except a set  $A$  of measure zero is polynomial  $ax^k + bx^{k-2} + \dots + \lambda$ , where the co-efficients are all positive and  $k$  is an even natural number.

**Theorem 2.6:** If  $f$  is continuous and  $LRD_n f(x)$  exists then  $LRD_n^+ f(x)$  has Darboux property.

**Proof.** Let us consider that  $LRD_n^+ f(x)$  does not have Darboux property, then there exist  $\alpha, \beta$  such that  $f(\alpha) < 0, f(\beta) > 0$  but  $LRD_n^+ f(x) \neq 0$  for any  $x \in (\alpha, \beta)$ .

Further, suppose  $E^+ = \{x \in [\alpha, \beta] : LRD_n^+ f(x) > 0\}, E^- = \{x \in [\alpha, \beta] : LRD_n^+ f(x) < 0\}$ , then  $[\alpha, \beta] = E^+ \cup E^-$ .

Let  $Q$  be (if any) non-degenerate component of  $E^+$ . Then  $Q$  is an interval. Suppose  $c, d$  be the end points of  $Q$ .

$LRD_n^+ f > 0$  in  $Q$ , so  $f$  is non-decreasing in  $Q$ .  $f$  being continuous and non-decreasing in  $[c, d]$ ,  $LRD_n^+ f(c), LRD_n^+ f(d) > 0$ . Therefore  $c, d \in Q$ , implies that  $Q$  is a closed interval.  $Q$  being arbitrary, every non-degenerate component of  $E^+$  is a closed interval. Following similar arguments, it can be shown that every non-degenerate component of  $E^-$  is a closed interval.

Let  $Q^+, Q^-$  be the collection of all non-degenerate components of  $E^+$  and  $E^-$  respectively. Let  $Q' = Q^+ \cup Q^-$ . Then any two distinct members of  $Q'$  are disjoint.

Hence,  $P = [\alpha, \beta] - \bigcup Q^0, Q \in Q'$ , is perfect and  $LRD_n^+ f$  has no point of continuity in  $P$  relative to  $P$ , which is a contradiction as  $LRD_n^+ f \in B[\alpha, \beta]$ .

Therefore,  $LRD_n^+ f(x)$  must have Darboux property.

**Theorem 2.7: Mean Value Theorem**

If  $f$  is continuous in  $[a, b]$  and  $LRD_n f(x)$  exists in  $(a, b)$  then there exists  $c \in (a, b)$  such that  $f(b) - f(a) = (b - a)LRD_n f(c)$ .

**Proof.** Here we may have following two cases -

Case 1: Let  $f(b) = f(a)$ .

Then,

Subcase 1- In case  $LRD_n f(x) \geq 0$  or  $LRD_n f(x) \leq 0$  in  $(a,b)$ . Thus  $f$  is monotone function. Now  $f$  being continuous as well as monotone,  $f$  is constant in  $(a, b)$ , ensuring the existence of  $c$ .

Subcase 2- In case  $f$  is not monotone,  $LRD_n f(\alpha) < 0$  and  $LRD_n f(\beta) > 0$  for some  $\alpha, \beta$  in  $(a, b)$  and hence there exists  $\xi \in (a, b)$  such that  $LRD_n f(\xi) = 0$ ?, implying  $c = \xi$ .

Case 2: Let  $f(b) \neq f(a)$ . Then, suppose  $\Phi(x) = f(x) - Ax$ ,  $A = \text{constant}$ . Clearly,  $\Phi$  is continuous in  $[a, b]$  and  $LRD_n \Phi(x)$  exists in  $(a, b)$ .

Also,  $LRD_n \Phi(x) = LRD_n f(x)$ .

Let us take  $A = \frac{f(b) - f(a)}{b - a}$ . Thus,  $\Phi(b) = \Phi(a)$ .

By Case 1, there exists  $c \in (a, b)$  such that  $LRD_n \Phi(c) = 0$

$$\Rightarrow LRD_n f(c) = \frac{f(b) - f(a)}{b - a}.$$

This completes the proof of the theorem.

### III. CONCLUSION

If  $f$  is continuous in  $[a, b]$ ,  $f(a) = f(b)$  and  $LRD_n f(x)$  exists in  $(a, b)$  then there exists  $c \in (a, b)$  such that  $LRD_n f(c) = 0$ .
